Ionospheric models and alternative approach

Ionospheric models and alternative approach

- International Reference Ionosphere (IRI)

Ionospheric models and alternative approach

- International Reference Ionosphere (IRI)
 - it is reliable at mid and low latitudes but does not work well at high latitudes

Ionospheric models and alternative approach

- International Reference Ionosphere (IRI)
 - it is reliable at mid and low latitudes but does not work well at high latitudes
- Empirical-Canadian High Arctic Ionospheric Model (E-CHAIM)

Ionospheric models and alternative approach

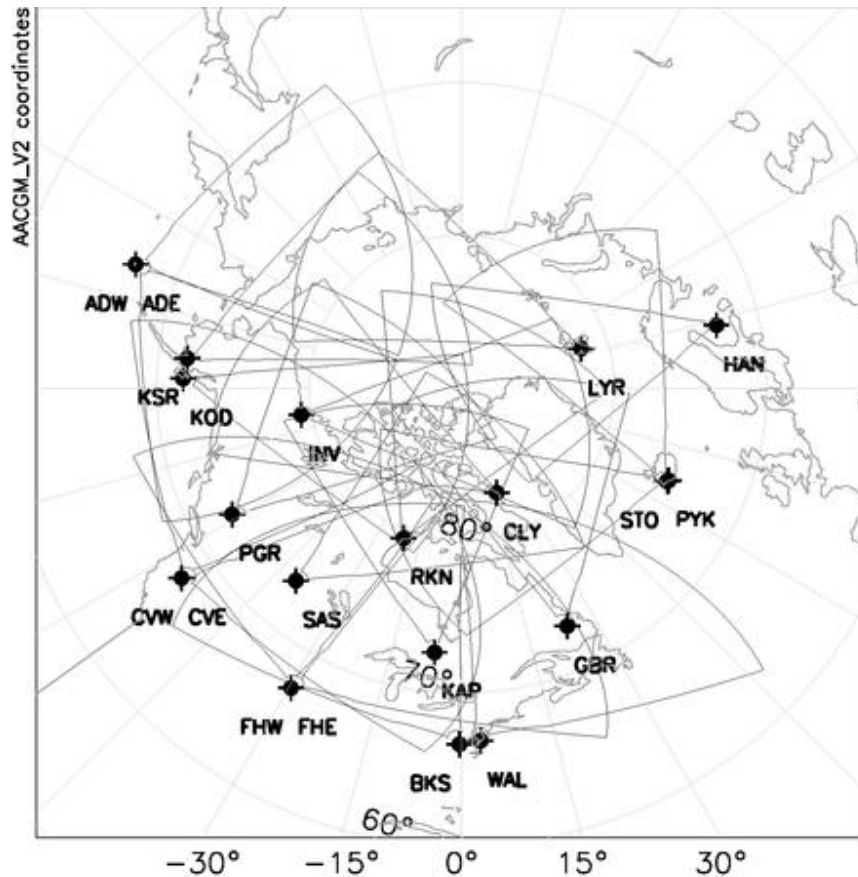

- International Reference Ionosphere (IRI)
 - it is reliable at mid and low latitudes but does not work well at high latitudes
- Empirical-Canadian High Arctic Ionospheric Model (E-CHAIM)
 - Based on ionosonde and GPS data from >50 deg latitude and performs better at auroral/polar regions

Ionospheric models and alternative approach

- International Reference Ionosphere (IRI)
 - it is reliable at mid and low latitudes but does not work well at high latitudes
- Empirical-Canadian High Arctic Ionospheric Model (E-CHAIM)
 - Based on ionosonde and GPS data from >50 deg latitude and performs better at auroral/polar regions
- We suggested an **alternative approach** based on direct observations of HF propagation characteristics by SuperDARN radars which would allow to bypass the ionospheric and propagation models.

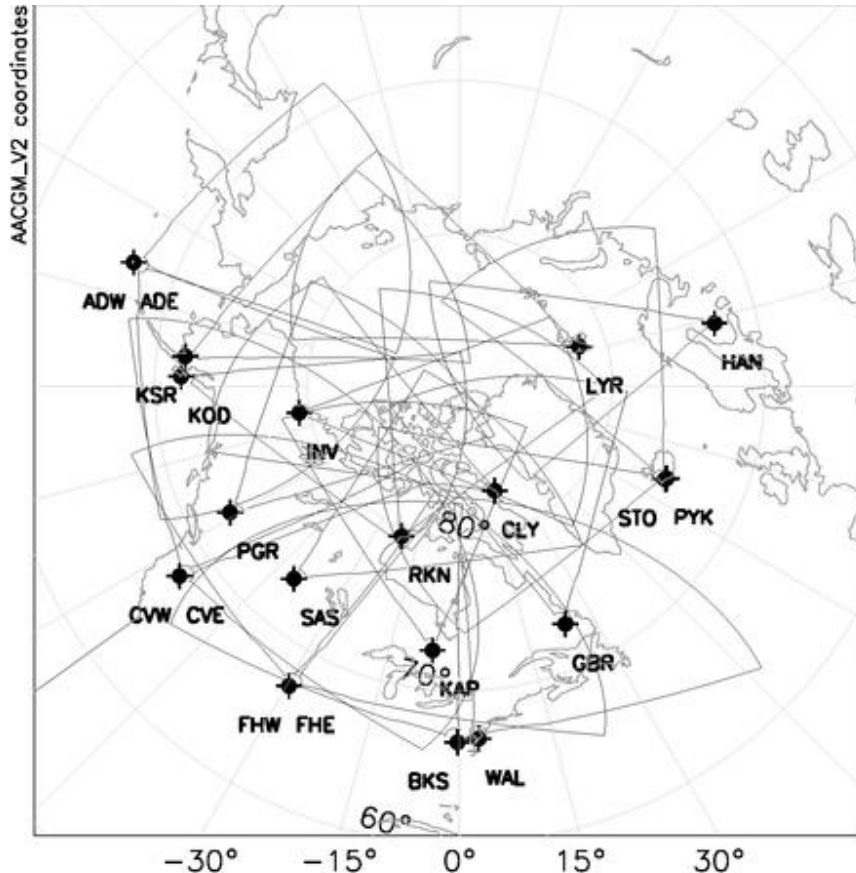

SuperDARN as a tool for monitoring HF propagation at high latitudes

SuperDARN as a tool for monitoring HF propagation at high latitudes

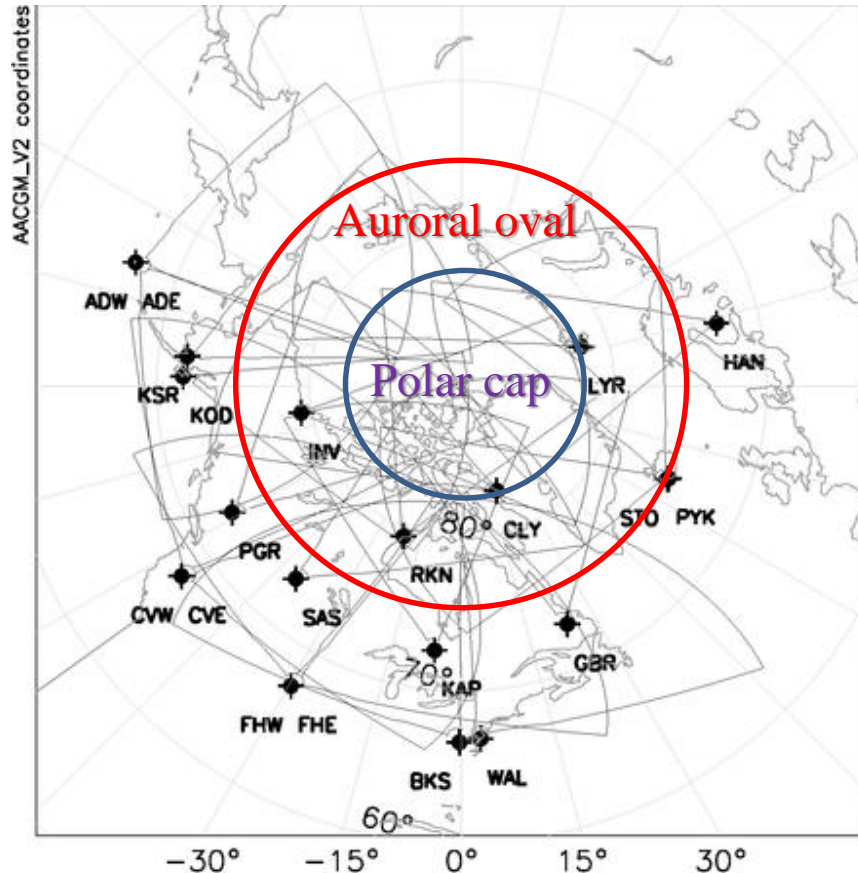

SuperDARN as a tool for monitoring HF propagation at high latitudes

- SuperDARN uses HF backscatter from ionospheric irregularities to measure plasma drifts and provides an extensive coverage of the auroral and polar cap regions

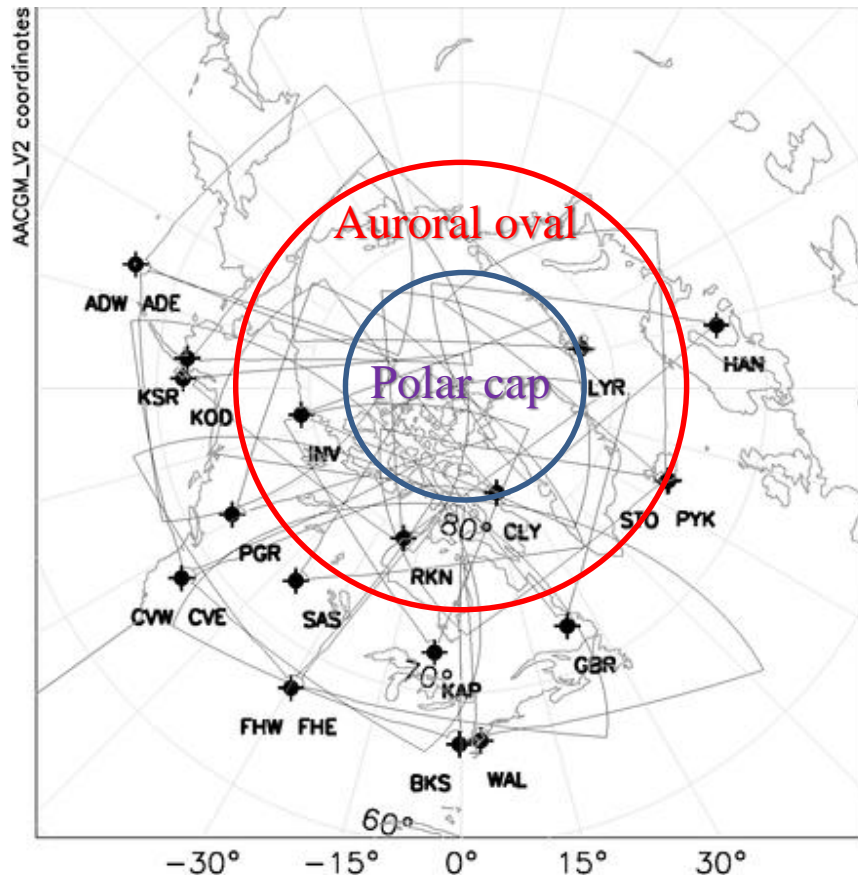

SuperDARN as a tool for monitoring HF propagation at high latitudes

- SuperDARN uses HF backscatter from ionospheric irregularities to measure plasma drifts and provides an extensive coverage of the auroral and polar cap regions

SuperDARN as a tool for monitoring HF propagation at high latitudes

- SuperDARN uses HF backscatter from ionospheric irregularities to measure plasma drifts and provides an extensive coverage of the auroral and polar cap regions
- We utilise **elevation angle** (vertical angle of arrival) for direct characterisation of HF propagation.
 - This approach was enabled by a recent progress in SuperDARN elevation angle calibration

Advanced applications: Elevation "ionogram"?

Advanced applications: Elevation "ionogram"?

There is a one-to-one relationship between elevation angle and plasma frequency at the scatter/reflection location:

Advanced applications: Elevation "ionogram"?

There is a one-to-one relationship between elevation angle and plasma frequency at the scatter/reflection location:

$$n_0 \cos \varphi_0 = n \cos \varphi_s$$

$$n_0 = 1, \varphi_s \approx 0^\circ \rightarrow \cos \varphi_0 \approx n$$

$$n^2 = 1 - f_p^2 / f_0^2$$

$$f_p \approx f_0 \sin \varphi_0$$

Advanced applications: Elevation "ionogram"?

There is a one-to-one relationship between elevation angle and plasma frequency at the scatter/reflection location:

$$n_0 \cos \varphi_0 = n \cos \varphi_s$$

$$n_0 = 1, \varphi_s \approx 0^\circ \rightarrow \cos \varphi_0 \approx n$$

$$n^2 = 1 - f_p^2 / f_0^2$$

$$f_p \approx f_0 \sin \varphi_0$$

Advanced applications: Elevation "ionogram"?

There is a one-to-one relationship between elevation angle and plasma frequency at the scatter/reflection location:

$$n_0 \cos \varphi_0 = n \cos \varphi_s$$

$$n_0 = 1, \varphi_s \approx 0^\circ \rightarrow \cos \varphi_0 \approx n$$

$$n^2 = 1 - f_p^2 / f_0^2$$

$$f_p \approx f_0 \sin \varphi_0$$

This means that we can replicate frequency ionogram with elevation sweep.

Advanced applications: Elevation "ionogram"?

There is a one-to-one relationship between elevation angle and plasma frequency at the scatter/reflection location:

$$n_0 \cos \varphi_0 = n \cos \varphi_s$$

$$n_0 = 1, \varphi_s \approx 0^\circ \rightarrow \cos \varphi_0 \approx n$$

$$n^2 = 1 - f_p^2 / f_0^2$$

$$f_p \approx f_0 \sin \varphi_0$$

This means that we can replicate frequency ionogram with elevation sweep.
